CORRECTION

A transport and retention mechanism for the sustained distal localization of Spn-F-IKKε during Drosophila bristle elongation

Tetsuhisa Otani, Kenzi Oshima, Akiyo Kimpara, Michiko Takeda, Uri Abdu and Shigeo Hayashi

There was an error published in Development 142, 2338-2351.

Otani et al. reported the genetic interactions between ikke and spn-F, using the allele ikke66. This allele was referred to in the Materials and Methods on p. 2349, Fig. 3 on p. 2343 and Table S1. However, they subsequently found that the allele used in the experiments was ikke1 (also known as ikke36). This was as a result of misannotation in their laboratory stock list. Both alleles are strong loss-of-function alleles with a missense mutation in the kinase domain and show similar phenotypes (Oshima et al., 2006; Shapiro and Anderson, 2006). Therefore, this error does not affect the conclusions of the paper.

The authors apologise to readers for this mistake.
